

# Custom and Legacy Application protection from pre-existing malwares and APTs

Enterprises face challenges to identify a pre-existing Advance Persistent Threats (APT) such as malware. As shown in the picture below, some applications may be owned by a malware. Without Avocado Security Platform protection, a malware will continue to spread laterally and infect other application instances and to steal confidential data.

Once Avocado Security Platform is installed and all applications are

registered with the Orchestrator, all owned applications are blocked by Avocado Security Platform. Further actions such as quarantine/kill are taken for owned application and communication details are sent for further analysis. As a result, all pre-existing malwares are caught, their lateral spread is contained.
